

Surface material with a second life

Polygood®

The Good Plastic Company produces Polygood®, a sustainable surface material made from 100% recycled and responsibly sourced. It is 100% recyclable, reducing waste and waste production.

Material origin

Our panels have already lived a previous life, refrigerator and freezer, and are 100% recycled. CD glasses, disposable cups, toys and games, disposable tableware and cutlery, and components for the kitchen and office. We source polystyrene from these and other post-consumer and post-industrial waste streams.

Carbon footprint (GWP) 487 kg / ton

Global warming potential is eight times lower than using virgin polystyrene. The assessment accounts for carbon dioxide, methane, nitrous oxide and other greenhouse gases; these results help us benchmark materials and guide improvements.

Material health

Polygood® has undergone independent testing for chemical content and indoor-air emissions. We verify our recycled polystyrene suppliers to support traceability and transparency across the supply chain.

- High structural integrity
- Lightweight
- Recyclable
- Thermoformable
- Strong and durable
- Consistent
- Low emissions
- Waterproof
- Mouldproof
